VI.ABSTRACT

The invention relates to a plastic bag suitable for crushing and dispensing an object, such as medicinal pill. The bag has an open end, is strong enough to withstand crushing forces, and includes a bottom seal that forms an angle of greater than 90° with the sides of the bag. For example, the bottom seal may be curved and concave toward the open end of the bag. The bag may also include a lip near the opening and formed by one of the bag walls. The bag may also include a gripper on any of (1) the interior or exterior surfaces of the lip or (2) the interior or exterior surface of the other wall. The bag may also include an indicator mark, e.g., a colored line near the opening to serve as a visual and/or tactile indicator for the user of the bag.
